

Functional annotation of transcripts

Lucile Soler
SciLifeLab RNAseq workshop
November 2018

The background of the slide features a large, abstract graphic composed of numerous thin, curved lines in shades of green, orange, and blue, forming a wave-like pattern that suggests motion and data flow. Overlaid on this graphic is the word "accelerate" in a bold, sans-serif font. The letters are colored in a gradient from dark purple to orange. The letter "e" is stylized with three small orange dots above it, and the letter "x" has three orange dots extending from its top and bottom.

1. Introduction to functional annotation

Functional annotation

- **What is functional annotation :**
 - Find out what the proteins/genes/transcripts do : function, domains ...
- **Why annotate RNAseq :**
 - To use annotated transcript for a first annotation (reduce noise, select annotated)
 - To use annotated transcript after annotation to for instance improve genome annotation
 - Know which genes are expressed depending on different tissues or life stages

Functional annotation – HOW?

- Experimentally
=> Mutants, knockout, etc.

Precise

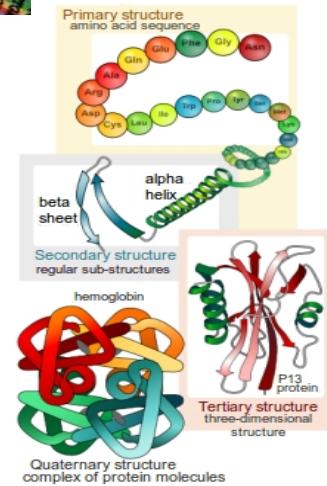

Mice homozygous for the diabetes 3J spontaneous mutation

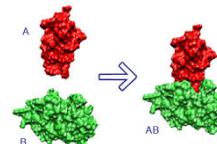

- Computationally
 - Sequence-based

- Structure based

- Protein-protein interaction data

limited accuracy

Methods - Sequence-based

- Based on similarity
=>Best blast hit

Q GLMDTAFEHIKATGGLTTESNYPYKGEDATCNS-KJ
GLM+ AFE+IK +GG+TTES YPY+ + TC++ +
S GLMENAFEYIKHSGGITTESAYPYRAANGTCDAVR

- Based on Motif/Patern
⇒Proscan, MEME, QuasiMotifFinder

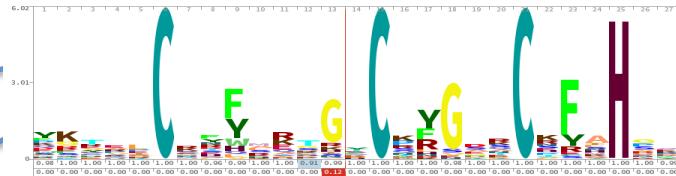

D-X-[KR]-P-{WYF}-X5

- Based on Profile (HMM or other statistical signature)

Whole sequence
e.g. Psi-BLAST*, PIRSF

domain
e.g. PFAM

Localization (e.g membrane, golgi, secreted)
e.g. SignalP, TMHMM

...
structural classification
e.g. SUPERFAMILY

- Based on evolutionary relationship (Orthology)
 - Gene are part of functional groups : KOG / COG
 - Based on synteny to check gene order *
 - ⇒ Whole genome alignment (lastZ)
 - (NBIS) Satsuma + kraken + custom script
 - Based on phylogeny to look at the evolution of set of genes*
 - ⇒ Quite complicated at large scale

* Can not be done on transcripts

- Similarity to known structures.

- Global structure-comparison
 - CATH and SCOP, the two most comprehensive structure-based family resources
- localized regions
 - might be relevant to function: clefts, pockets and surfaces
- active-site residues (catalytic clusters and ligand-binding sites)
 - active-site residues is often more conserved than the overall fold
⇒PDBSiteScan

no single method is always successful

Functional annotation – HOW?

It is actually kind of complex...

- Multi-dimensional problem :
 - e.g. A protein can have a molecular function, a cellular role, and be part of a functional complex or pathway
- Molecular function can be illustrated by multiple descriptive levels
 - (e.g. '**enzyme**' category versus a more specific '**protease**' assignment).

Functional annotation – HOW?

It is actually kind of complex...

- Similarities (structural or in sequence)  function.
 - Similar sequence but different function (new domain => new combination => different function)
 - Different sequence may have same function (convergence) : Profiles helpful
 - Two proteins may have a similar fold but different functions
- Looks for conserved domains more reliable than whole sequence ?
 - How to go from conserved domains to assigning a function for your protein?

=> Importance to gathering as much information as possible

Sequence-based methods

- The most used (popular)
- Quick
- Easy to use
- Accurate (>70%)

Watson JD, Sanderson S, Ezersky A, Savchenko A, Edwards A, Orengo C, Joachimiak A, Laskowski RA, Thornton JM: Towards fully automated structure-based function prediction in structural genomics: a case study. *J Mol Biol.* 2007, 367: 1511-1522. 10.1016/j.jmb.2007.01.063.

- Many resources: even structural domains information
- Less computationally demanding

2. Blast based approach

Functional annotation – HOW?

Get sequences

Search
similar
function

Blast-based
approach

Blast-based approach

Annotate the sequences functionally using Blast

Choose
database

Uniprot	Swissprot
exhaustive	reliable

Blast-based approach

Annotate the sequences functionally using Blast

Choose
database

Fasta
aa

blast

! Minimum Threshold

Blast-based approach

Strengths

- Fairly fast and easy
- Allow gene naming

Limits

- Orthology not certain - best blast-hit does not equal orthologous!
- Bias due to well conserved domains
- Best Hit (use as template) is not necessary the best annotated sequence to use => Could apply a prioritization rule (Human first, then mouse, etc).

Blast-based approach

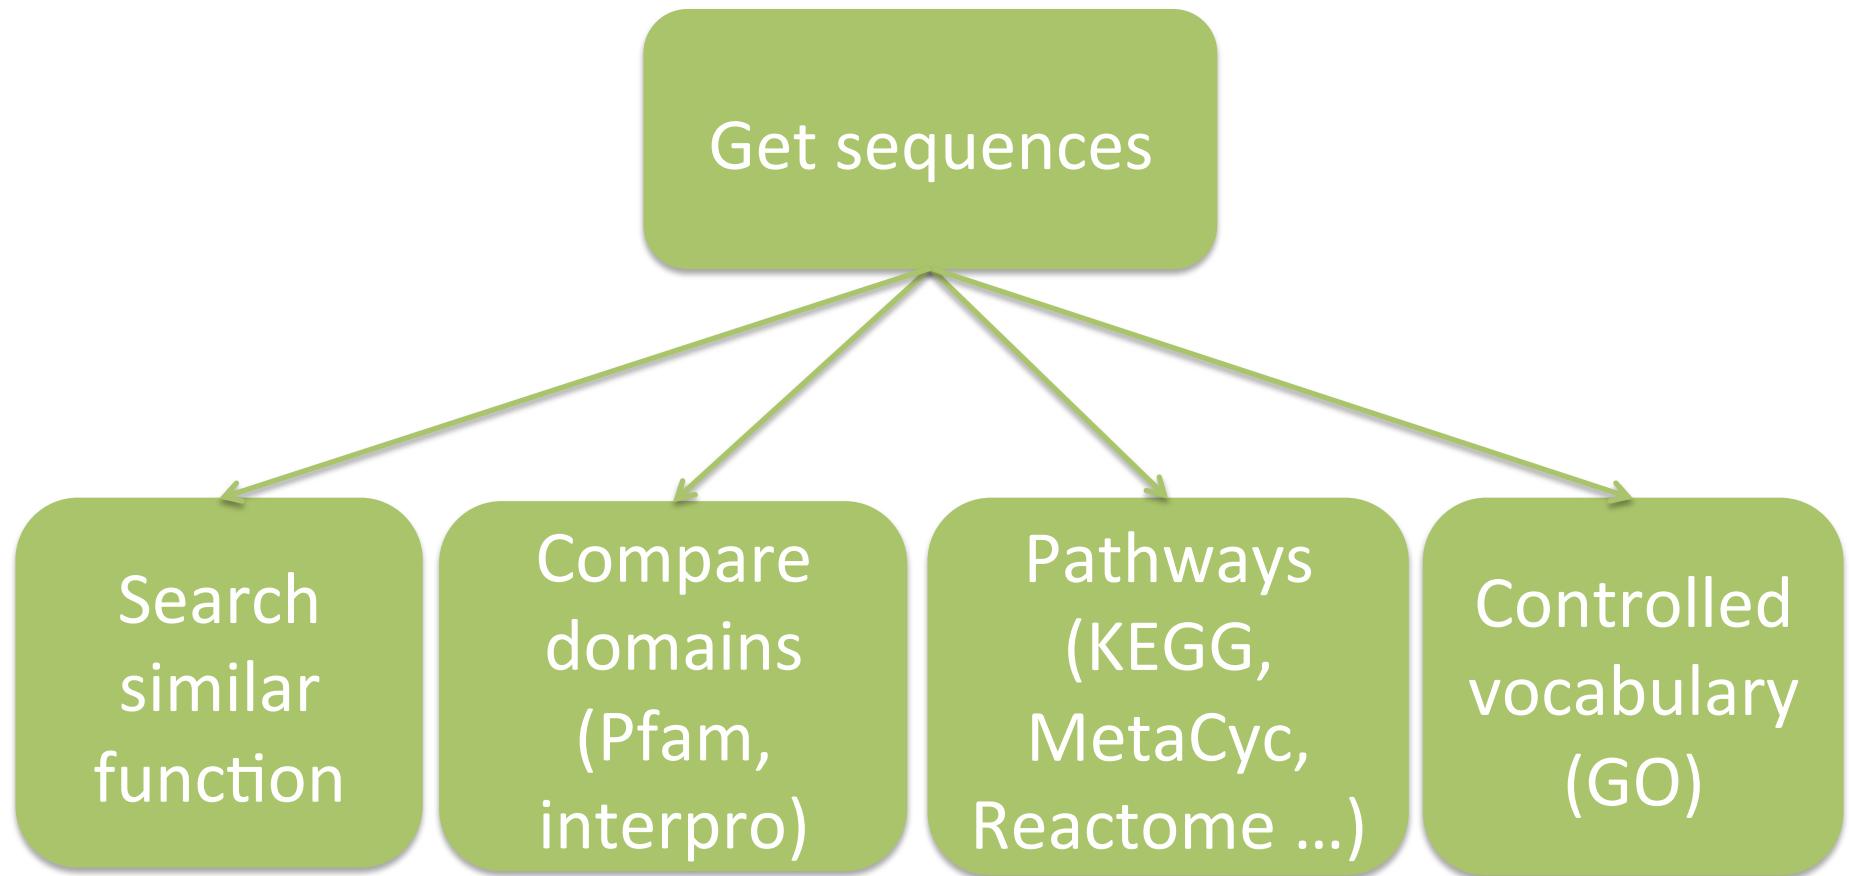

Blast-based annotation are tightly dependent to the quality of the transcript assembly

- Gene Fusion
- Gene split
- Gene Partial (Well conserved domain)
- Over prediction
- Wrong ORF

3. Domains/profiles/patterns approach

Functional annotation – HOW?

Databases

Database	Information	Comment
KEGG	Pathway	Kyoto Encyclopedia of Genes and Genomes
MetaCyc	Pathway	Curated database of experimentally elucidated metabolic pathways from all domains of life (NIH)
Reactome	Pathway	Curated and peer reviewed pathway database
UniPathway	Pathway	Manually curated resource of enzyme-catalyzed and spontaneous chemical reactions.
GO	Gene Ontology	Three structured, controlled vocabularies (ontologies) : biological processes, cellular components and molecular functions
Pfam	Protein families	Multiple sequence alignments and hidden Markov models
Interpro	Protein families, domains and functional sites	Run separate search applications, and create a signature to search against Interpro.

Have a look on the Interpro web page: All the database they search into are listed. It gives a nice overview of different types of databases available.

Gene Ontology

Gene Ontology: the framework for the model of biology. The GO defines concepts/classes used to describe gene function, and relationships between these concepts. It classifies functions along three aspects:

GO term prediction

Biological Process

-  [GO:0006631](#) fatty acid metabolic process
-  [GO:0006635](#) fatty acid beta-oxidation
-  [GO:0008152](#) metabolic process
-  [GO:0055114](#) oxidation-reduction process

Molecular Function

-  [GO:0003824](#) catalytic activity
-  [GO:0003857](#) 3-hydroxyacyl-CoA dehydrogenase activity
-  [GO:0004300](#) enoyl-CoA hydratase activity
-  [GO:0016491](#) oxidoreductase activity
-  [GO:0016616](#) oxidoreductase activity, acting on the CH-OH group of donors, NAD or NADP as acceptor
-  [GO:0050662](#) coenzyme binding

Cellular Component

-  [GO:0005739](#) mitochondrion
-  [GO:0016507](#) mitochondrial fatty acid beta-oxidation multienzyme complex

More than 60 000 terms

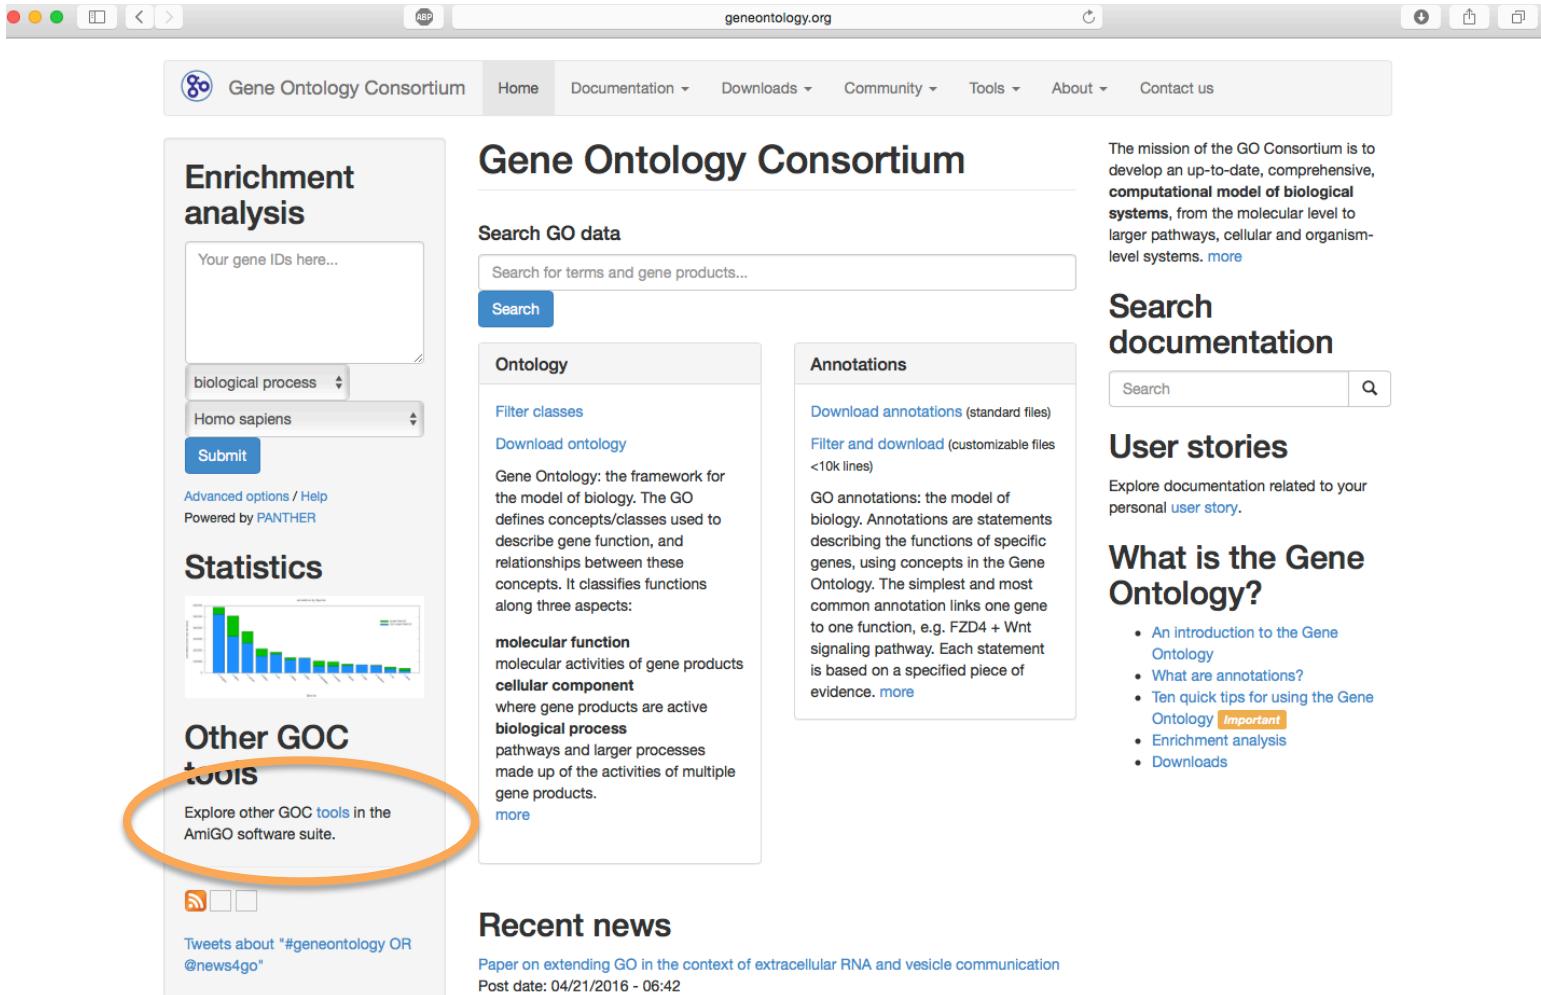

pathways and larger processes made up of the activities of multiple gene products.

molecular activities of gene products

where gene products are active

Gene Ontology

<http://www.geneontology.org/>

The screenshot shows the homepage of the Gene Ontology Consortium. At the top, there's a navigation bar with links for Home, Documentation, Downloads, Community, Tools, About, and Contact us. Below the navigation is a main content area.

Enrichment analysis section (left sidebar):

- Form for "Your gene IDs here..."
- Dropdown menus for "biological process" and "Homo sapiens".
- A "Submit" button.
- Links for "Advanced options / Help" and "Powered by PANTHER".

Statistics section:

- A bar chart titled "Distribution of GO terms across species".

Other GOC tools section (circled in orange):

- Text: "Explore other GOC tools in the AmiGO software suite."
- Social media icons for RSS, GitHub, and Bitbucket.
- Tweets about "#geneontology OR @news4go" (with a count of 1).

Gene Ontology Consortium section (main header):

3. Tools

Tools

Tool	Approach	Comment
Trinotate	Best blast hit + protein domain identification (HMMER/ PFAM) + protein signal peptide and transmembrane domain prediction (signalP/tmHMM), and leveraging various annotation databases (eggNOG/GO/Kegg databases).	Not automated
Annocript	Best blast hit	Collects the best-hit and related annotations (proteins, domains, GO terms, Enzymes, pathways, short)
Annot8r	Best blast hits	A tool for Gene Ontology, KEGG biochemical pathways and Enzyme Commission EC number annotation of nucleotide and peptide sequences.
Sma3s	Best blast hit + Best reciprocal blast hit + clusterisation	3 annotation levels
afterParty	BLAST, InterProScan	web application
Interproscan	Run separate search applications HMMs, fingerprints, patterns => InterPro	Created to unite secondary databases
Blast2Go	Best* blast hits	Retrieve GO and other domains Commercial !

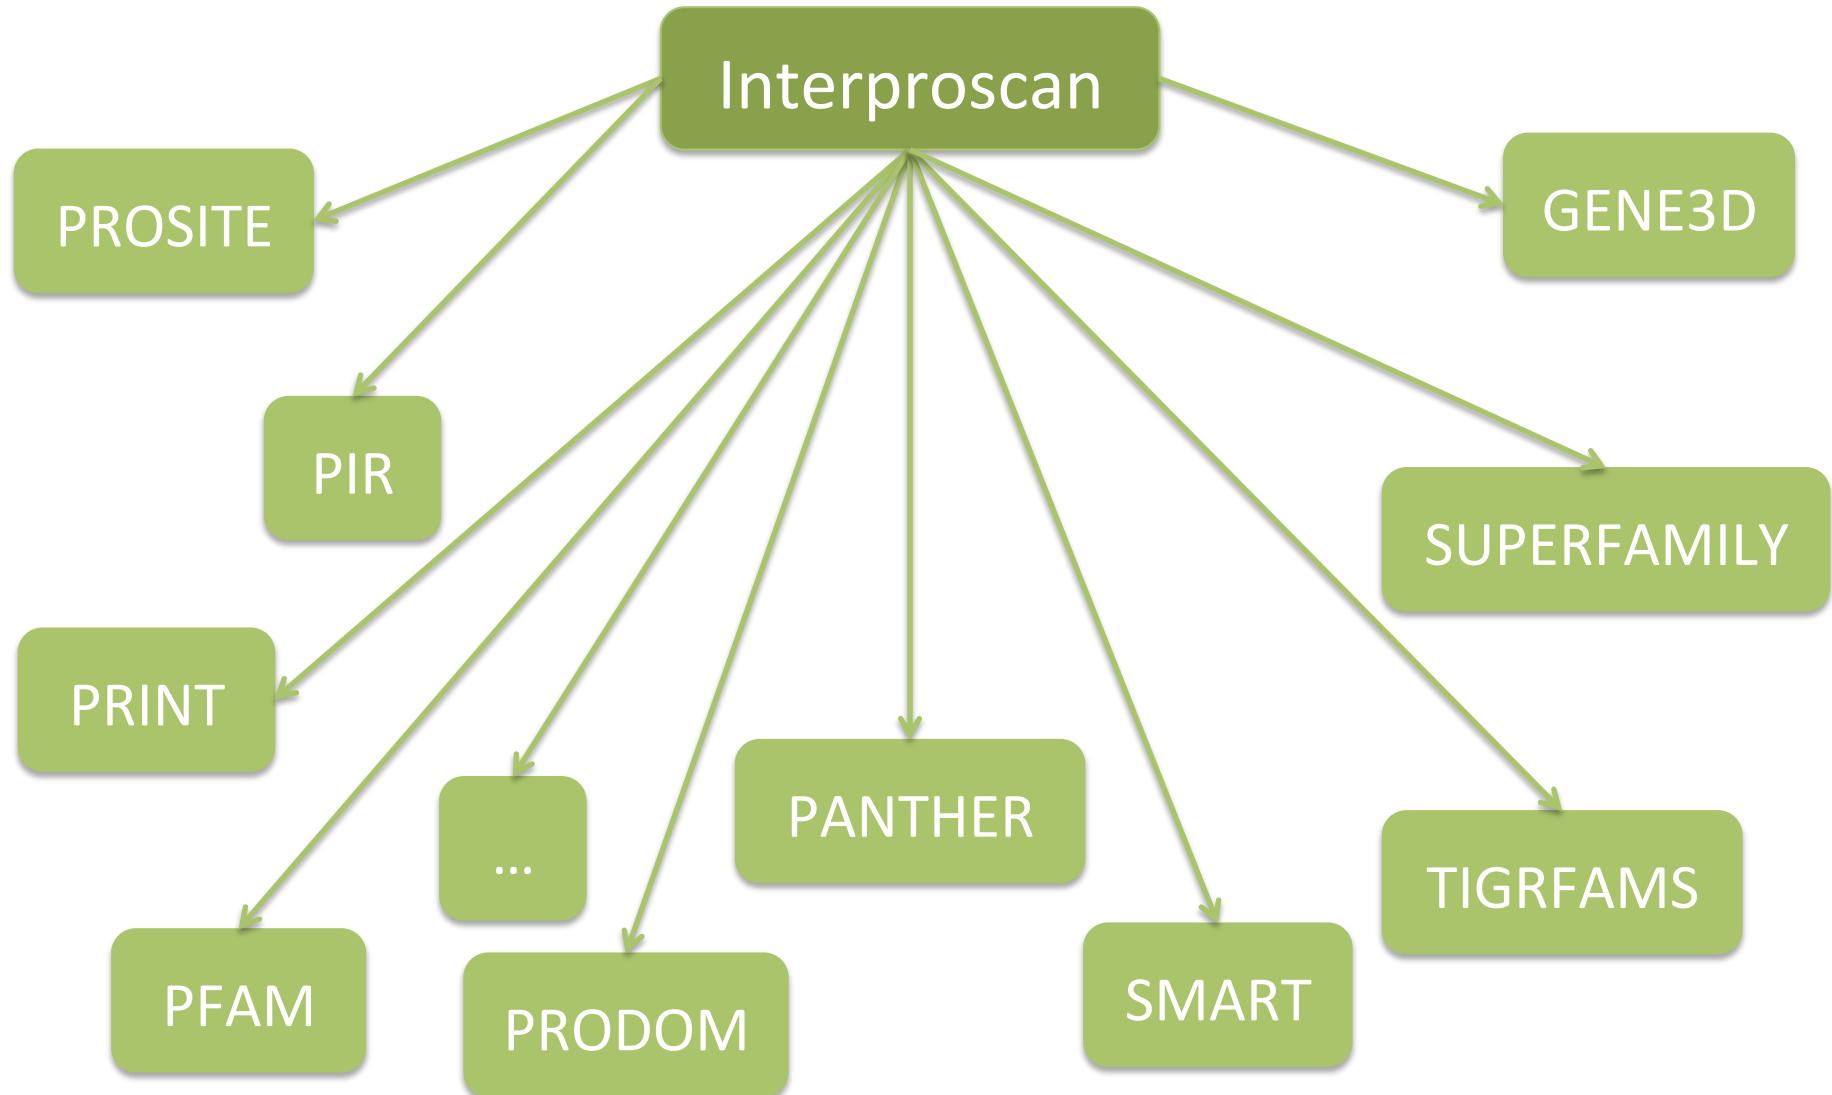

Interproscan

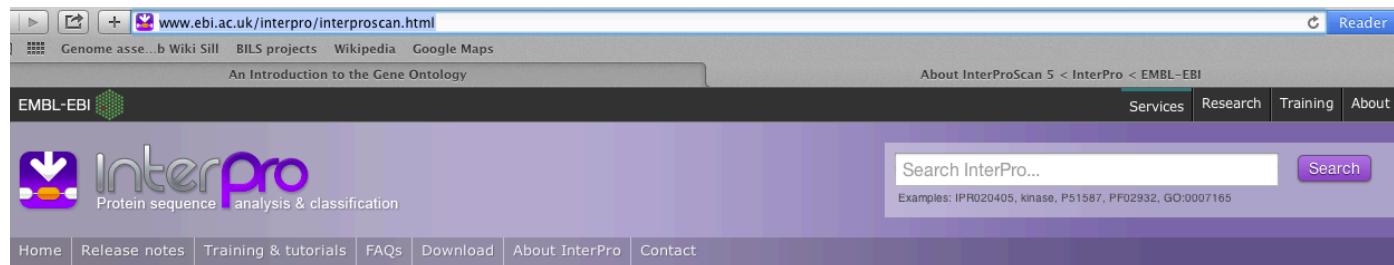

“InterPro is a resource that provides functional analysis of protein sequences by classifying them into families and predicting the presence of domains and important sites.

To classify proteins in this way, InterPro uses predictive models, known as signatures, provided by several different databases (referred to as member databases) that make up the InterPro consortium.”

<https://www.ebi.ac.uk/interpro/about.html>

- Annotate the sequences functionally using Interproscan

The screenshot shows the EBI InterPro homepage. At the top, there's a navigation bar with links like 'Home', 'Release notes', 'Training & tutorials', 'FAQs', 'Download', 'About InterPro', and 'Contact'. Below the navigation is a search bar with the placeholder 'Search InterPro...' and a 'Search' button. To the right of the search bar, it says 'Examples: IPR020405, kinase, P51587, PF02932, GO:0007165'. The main content area features the 'InterPro' logo and the text 'Protein sequence analysis & classification'. There are also links for 'Services', 'Research', 'Training', and 'About us'.

About InterProScan

What is InterProScan?

InterProScan is the software package that allows sequences (protein and nucleic) to be scanned against InterPro's signatures. Signatures are predictive models, provided by several different databases (referred to as member databases), that make up the InterPro consortium.

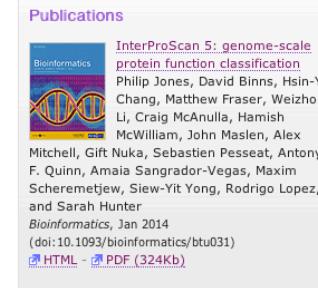

The software is available:

- As a web-based tool, using the sequence search box on the [InterPro homepage](#), for the analysis of single protein sequences (also available in the [EBI tool section](#))
- Programmatically via Web services that allow up to 25 sequences to be analysed per request (both [SOAP](#) and [REST](#)-based services are available)
- As a downloadable package for local installation from the EBI's FTP server, for instructions see the [detailed documentation pages](#).

InterProScan is run regularly against UniProtKB and the results are made available via the InterPro website.

More information

For more information, and for instructions on how to obtain, install and run InterProScan, please see the [detailed documentation pages](#).

Trinotate

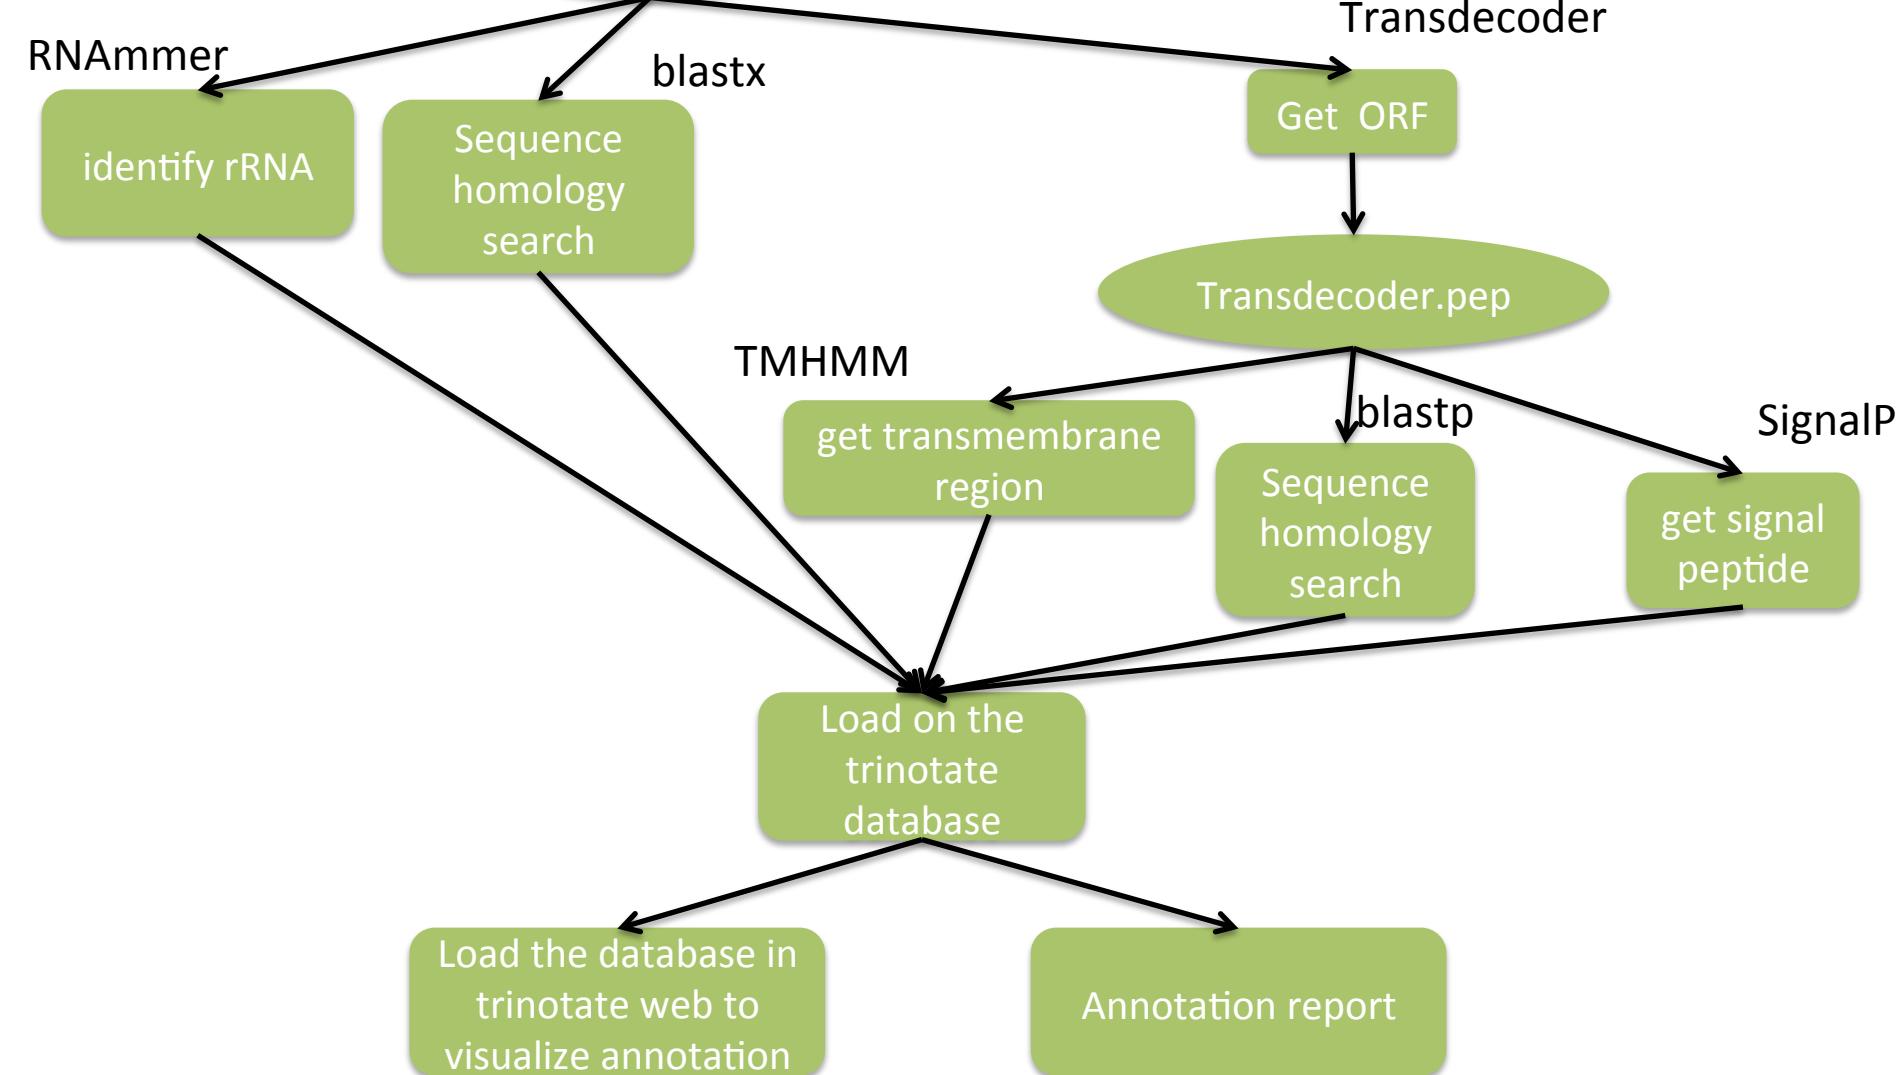

Trinotate

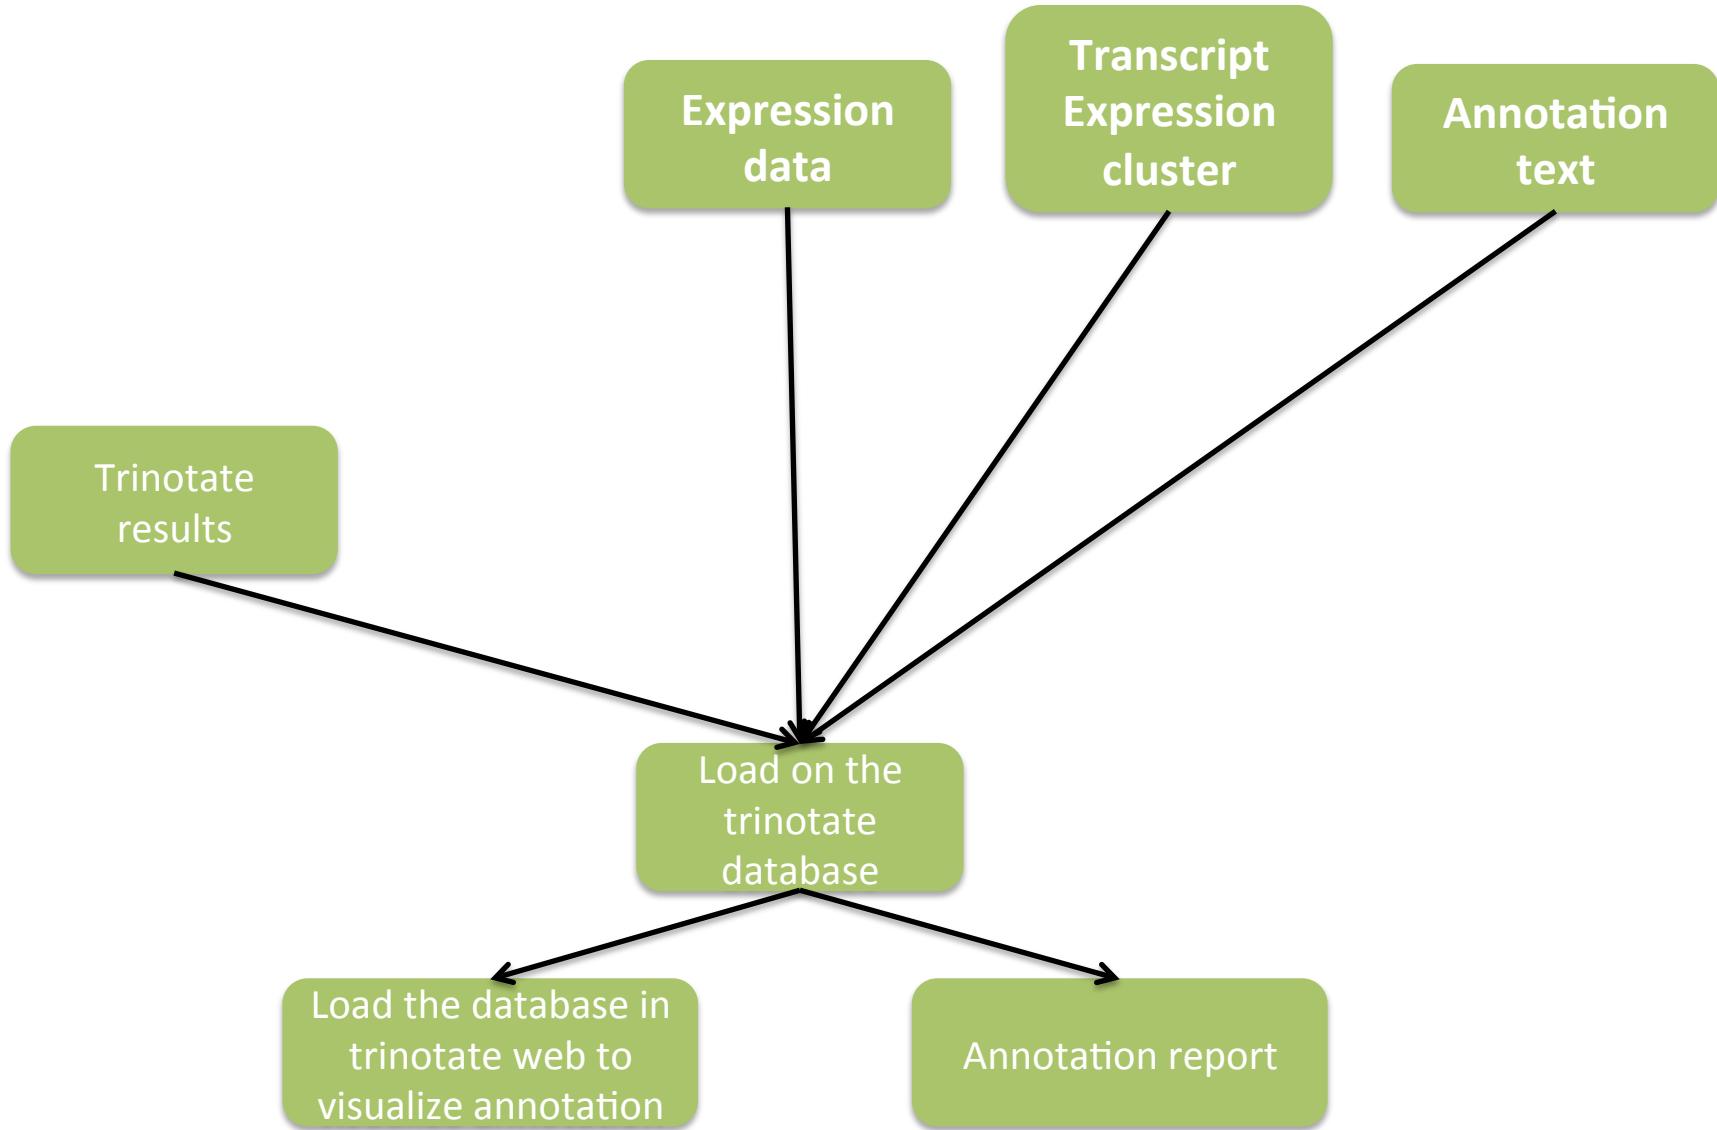

- Trinotate is a suite tools that was created to annotate specifically Trinity output
- Can also work with any fasta file if suitable inputs are available
- Now exists in pipeline

Get/create the SQLite database

Trinotate retrieve uniprot and pfam database
that will be needed later
It also create a trinotate database that will be populate later

Trinotate output

- Can create a report file (tabulated file)
- Number of columns depends on what you integrate in your database, if you integrate more blast or expression data you will have more columns

```
#gene_id      transcript_id  sprot_Top_BLASTX_hit  RNAMMER prot_id prot_coords

4. Conclusion

- Functional annotation found
/!\ Transmission of error from databases !
Experimental check is good !
- Hypothetical protein / Uncharacterized protein
=> depends largely on conventional experiments.

Knowing the function is not enough: Chimp and human => 98% similarity

=> Knowledge of other parameters useful (pathway, positional and temporal regulation of genes)

THE END

<https://github.com/NBISweden/GAAS>
